

Beat the Heat

[ProAsys](#) appreciates the opportunity to help achieve and maintain control of your HVAC water systems. Proper treatment will *reduce* water and energy costs, *extend* equipment life and will ensure that your system is operating at peak efficiency - allowing you to stay cooler in the summer and warmer in the winter.

Keep it Clean

Systems circulating dirt and debris will be susceptible to corrosion and microbiological fouling. This will cause equipment failure and interfere with operating/performance.

Consider purchasing filtration for systems consistently exposed to contaminants or rent the [ProAsys portable filter](#) unit to clean a dirty system.

Aluminum Systems

Equipment with aluminum heat transfer surfaces can offer energy efficiency advantages and will typically be less expensive than steel components. However, these systems are extremely sensitive and have specific treatment needs. Notify your ProAsys representative prior to installing aluminum components.
